

Cable-Driven Oil Pumps By

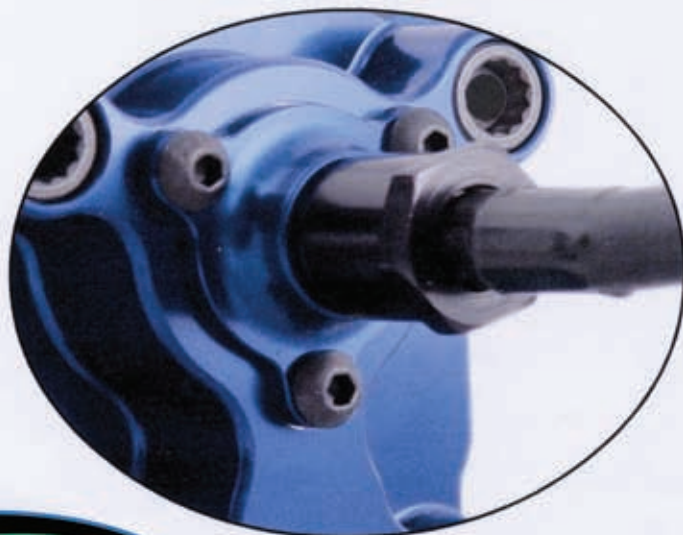

Raceline's new Cable-Driven Oil Pump was designed to remotely drive Waterman Racing Products' new cable-driven fuel pump. The advantage of driving the fuel pump from the rear of the oil pump is that the fuel pump is mounted on the fuel tank plate instead of on the side of the engine. As a result, damage to the fuel pump from major impacts, and the resulting fire, is virtually eliminated.

Another major safety feature of the cable-driven design is that the large main fuel line is no longer connected to the engine. This greatly reduces the risk of fire, because fluid cannot pass through the fuel pump unless the pump is turning.

Most Raceline oil pumps can be converted to the new cable-driven style requiring just a simple retrofit.

Cable-driven fuel pump kits are available at Waterman Racing Products and Raceline Oil Pumps.
